Plate-forme de modélisation et d'étude de la variabilité spatio-temporelle des flux au sein du bassin amazonien

Plate-forme Umodelis

S. Gardoll¹, G. Cochonneau¹, M.P. Bonnet¹

¹ (LMTG, Brasilia)

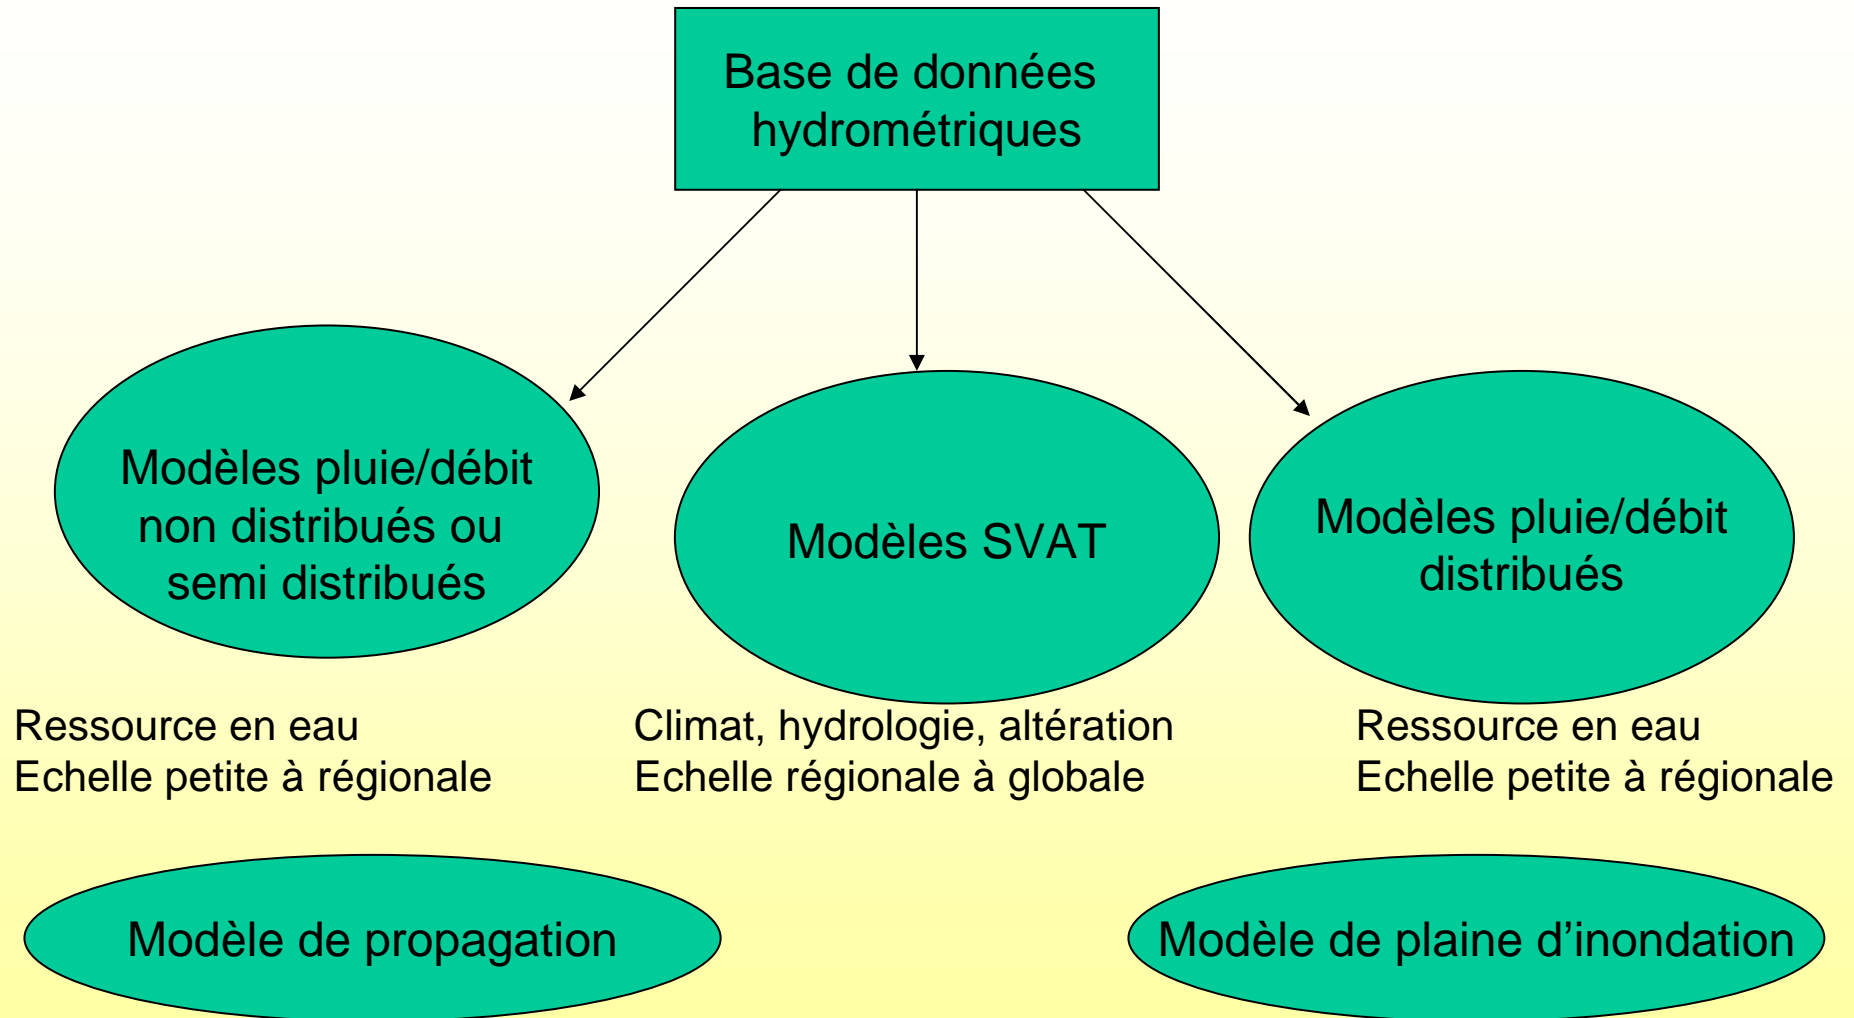

UNB

Objectifs

- ❑ Capitalisation des données, outils et modèles utilisés par les différentes communautés scientifiques s'appuyant sur l'ORE HyBAM
- ❑ Renforcer la coopération régionale entre les différents pays du bassin Amazonien en unifiant les bases de données et les outils et modèles
- ❑ Faciliter la formation à la modélisation

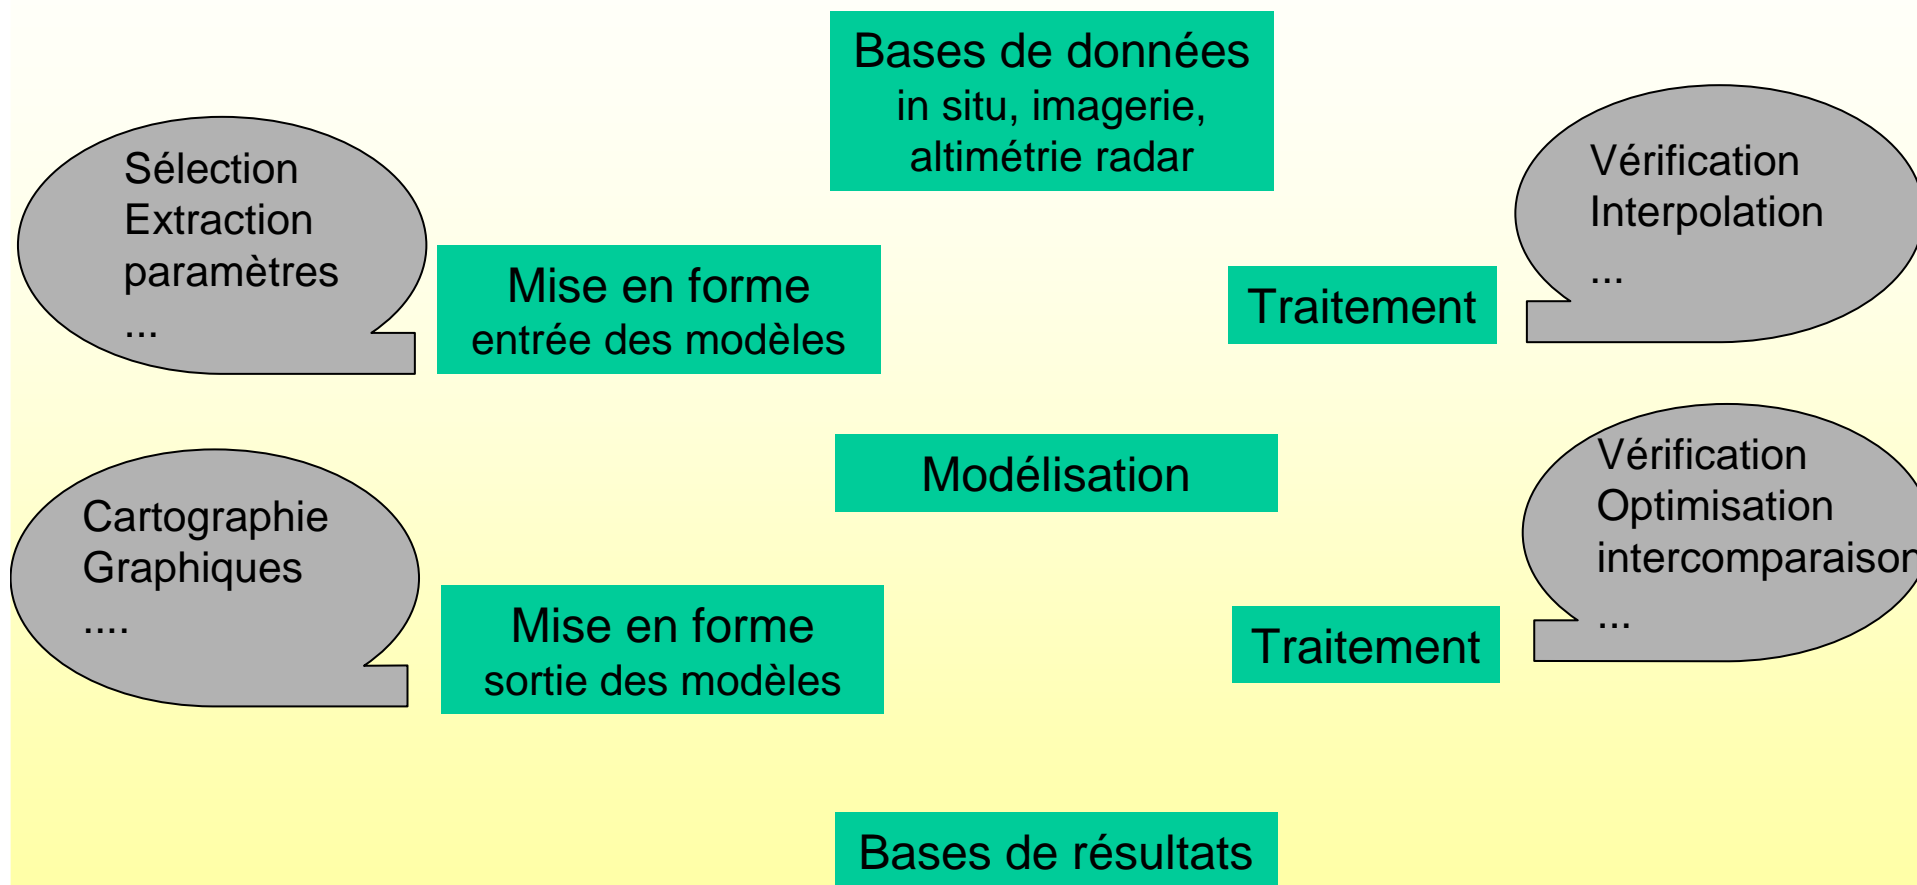

Les modèles dans HyBAM ...

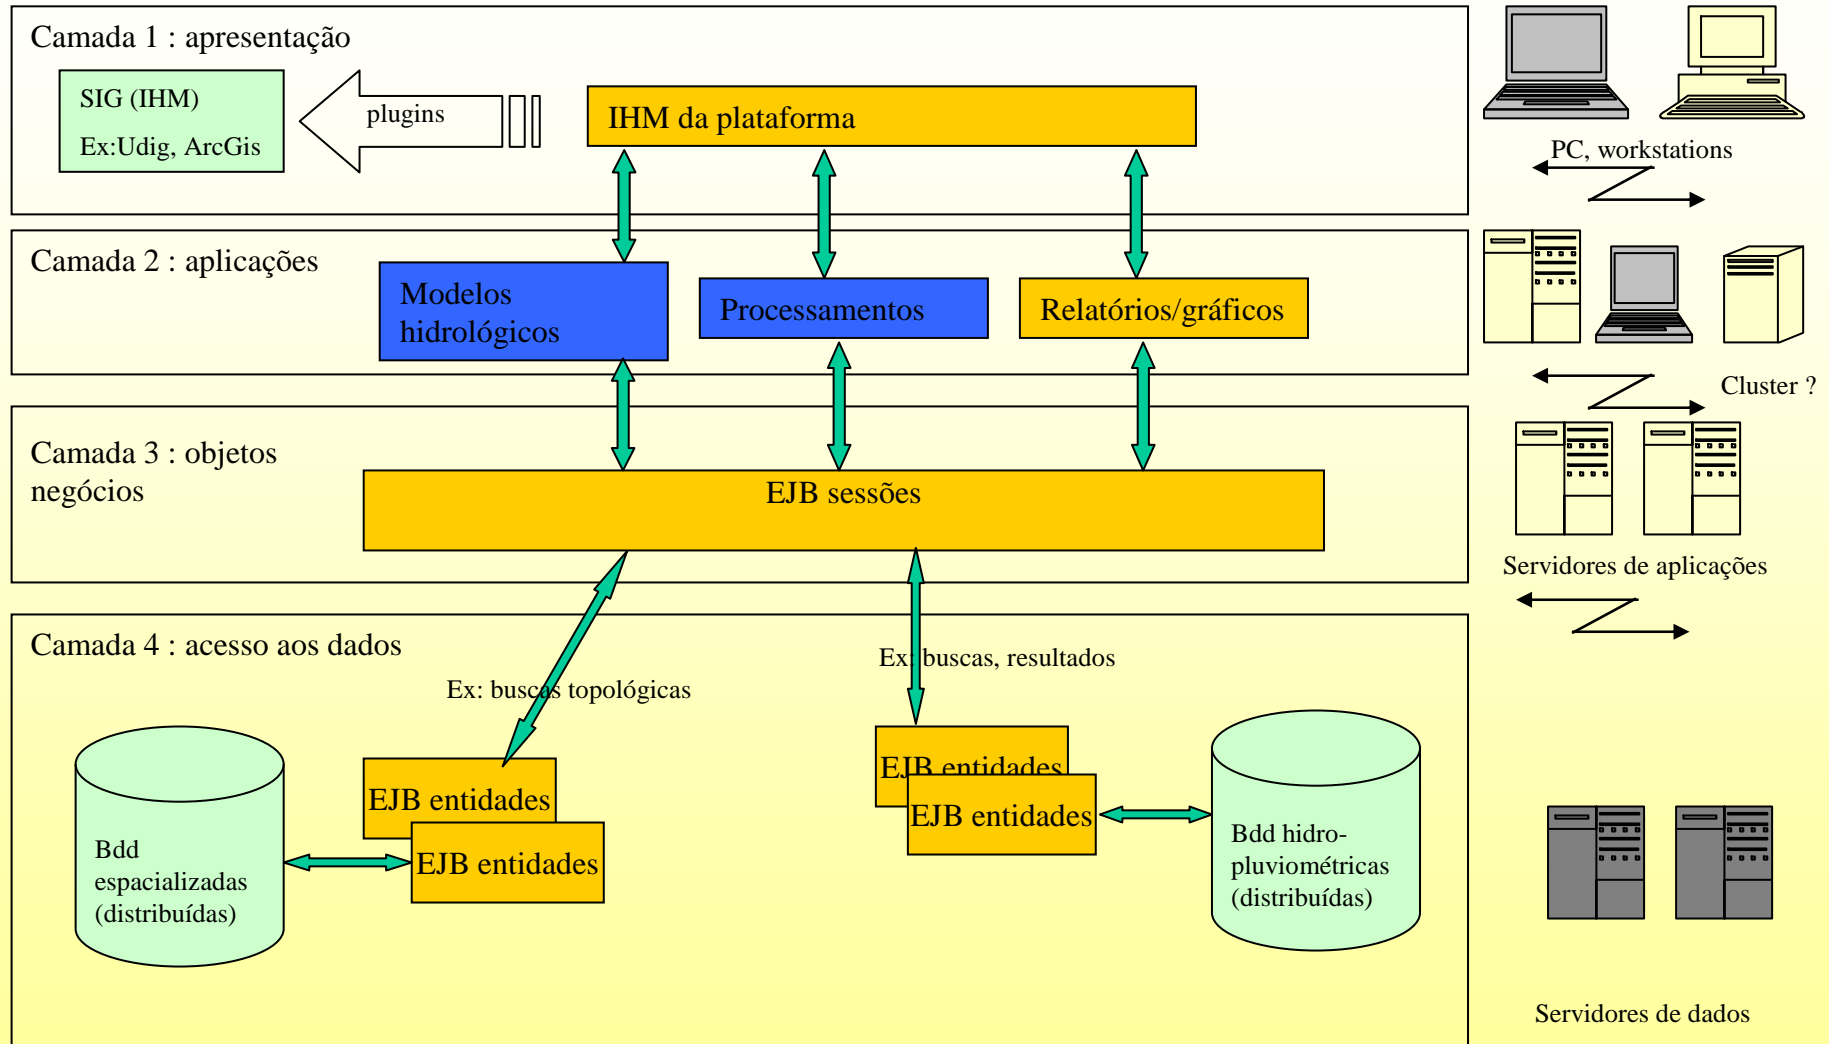

Nécessité de

- 1) Capitaliser les développements et résultats des modèles
- 2) Favoriser la synergie entre les approches

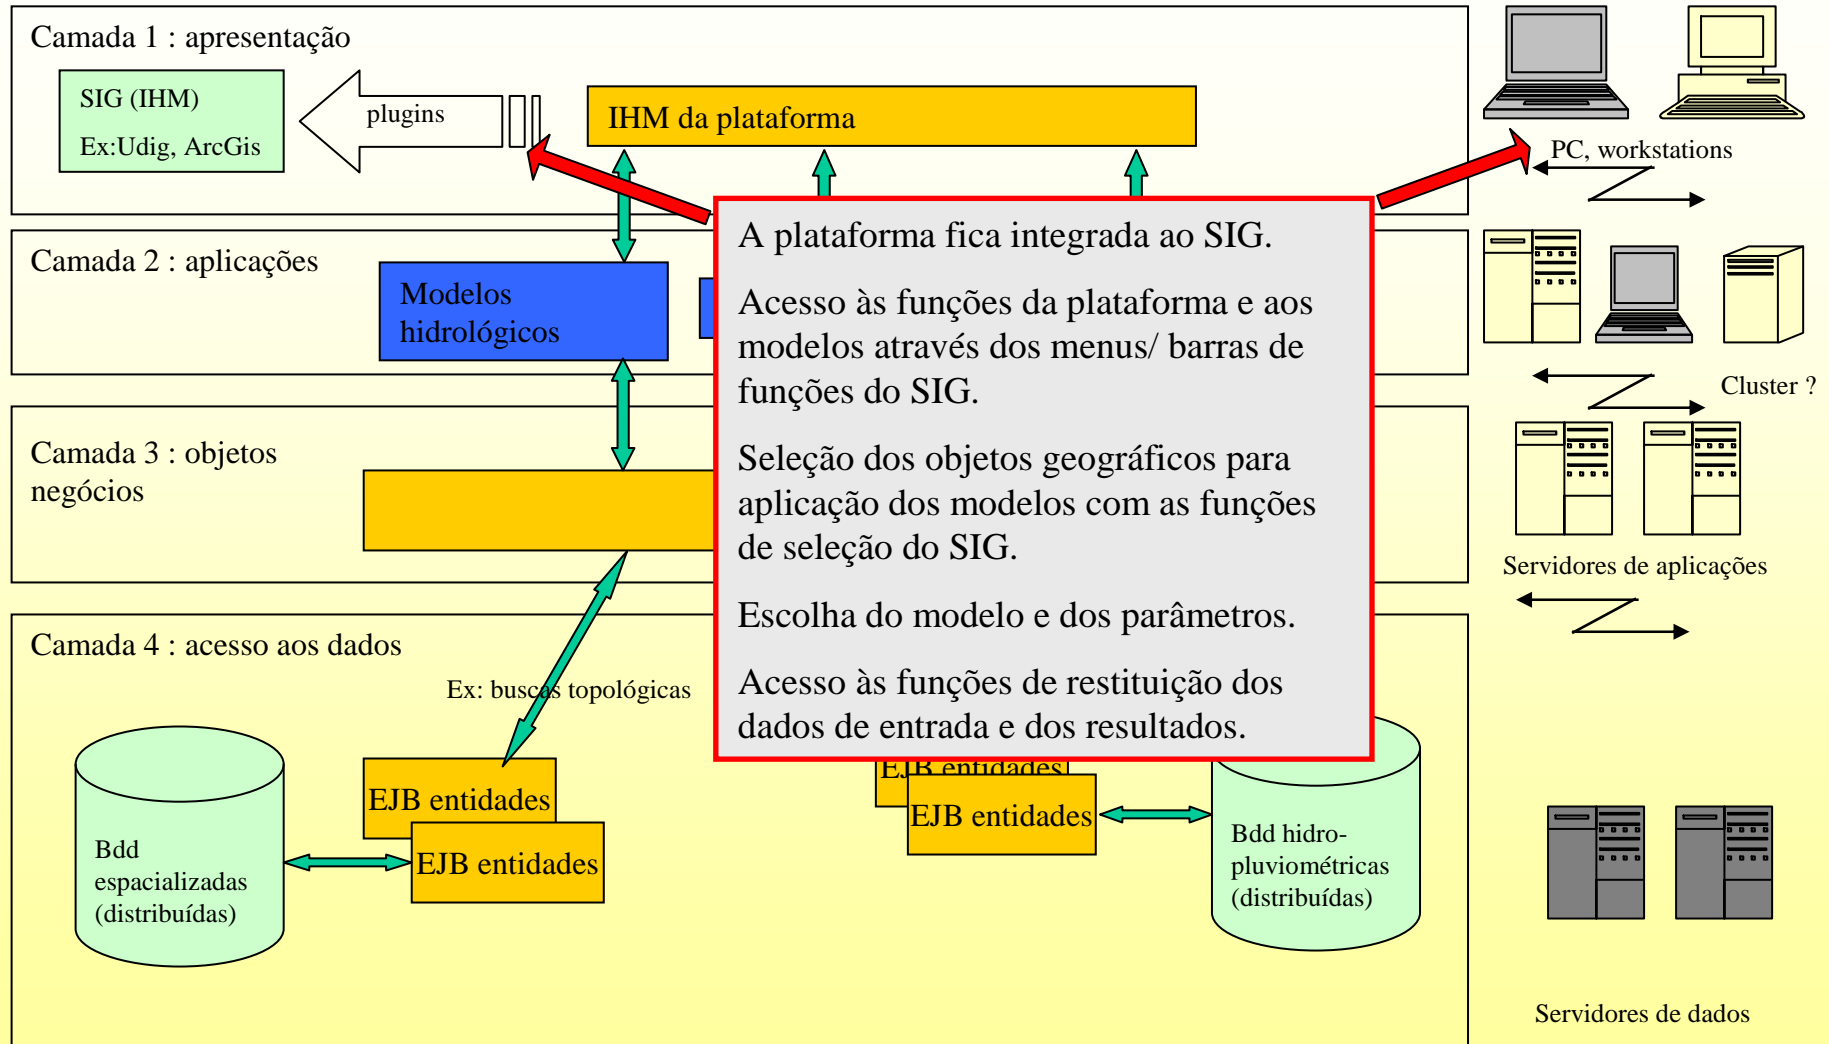

Une plateforme de modélisation intégrée

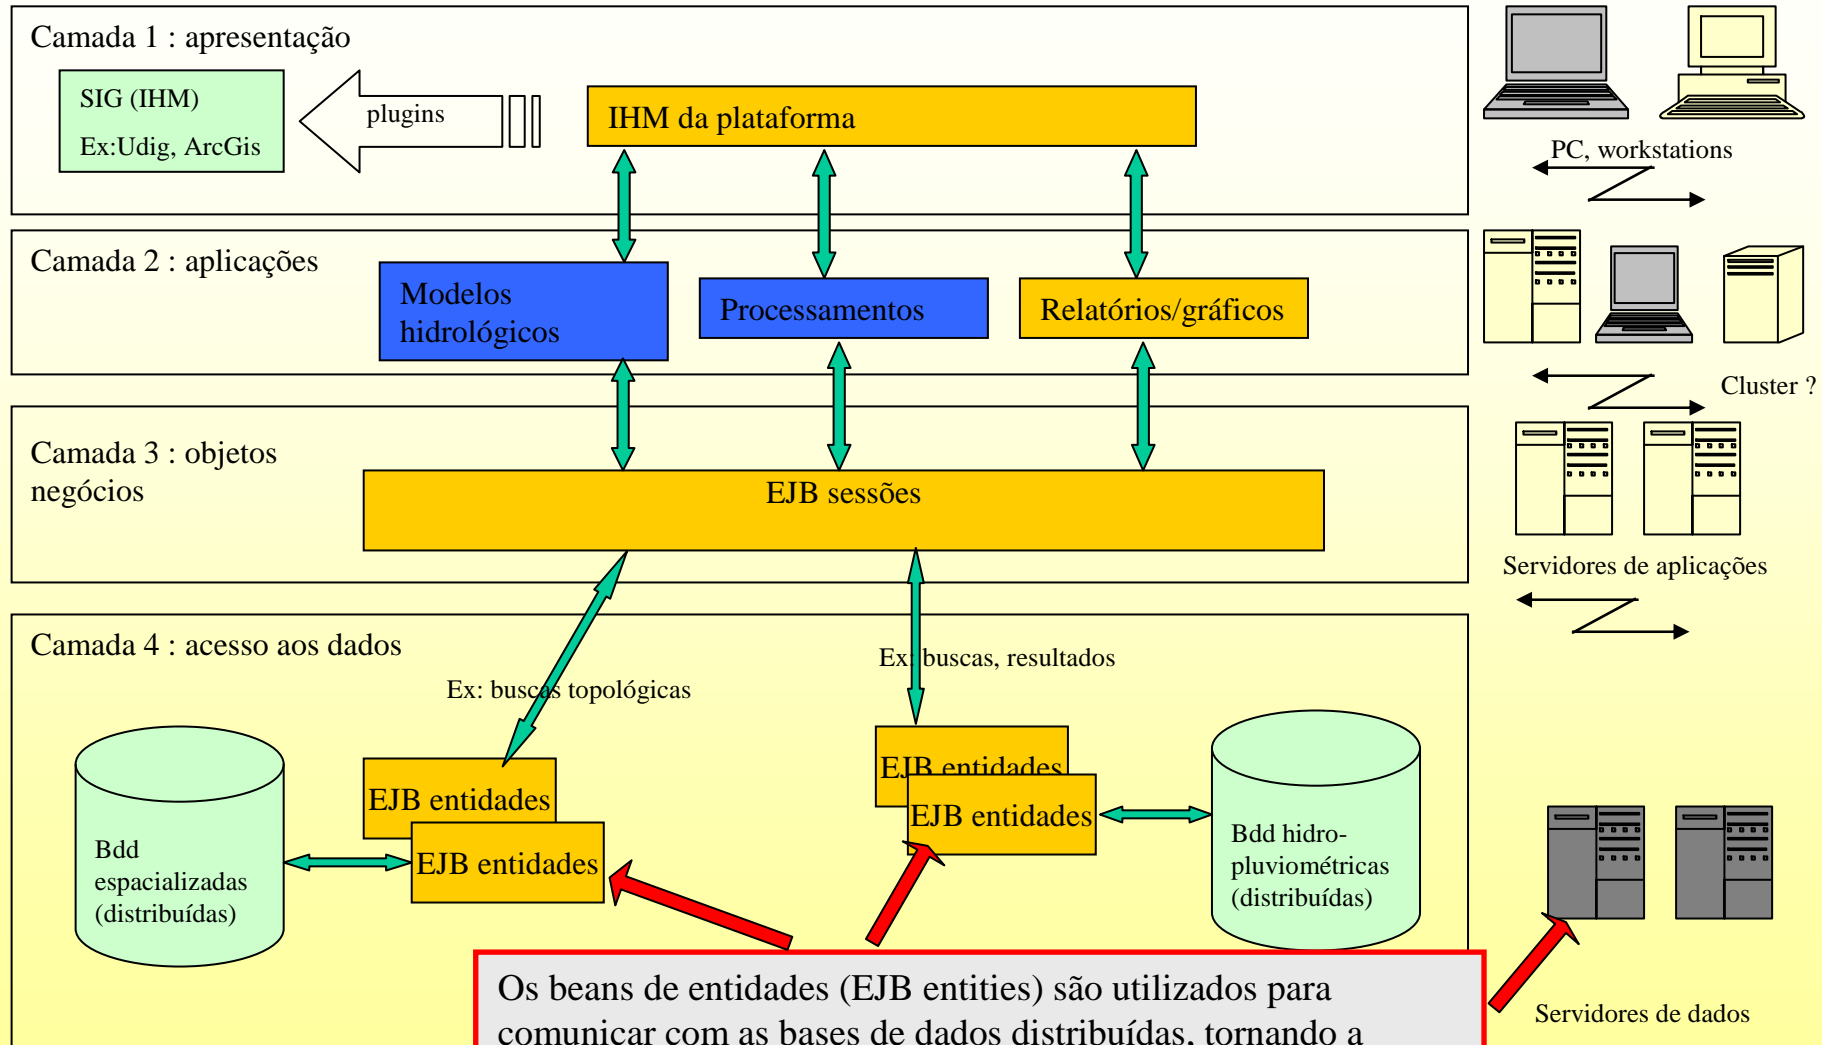

Plataforma de modelagem - Arquitetura

Plataforma de modelagem - Arquitetura

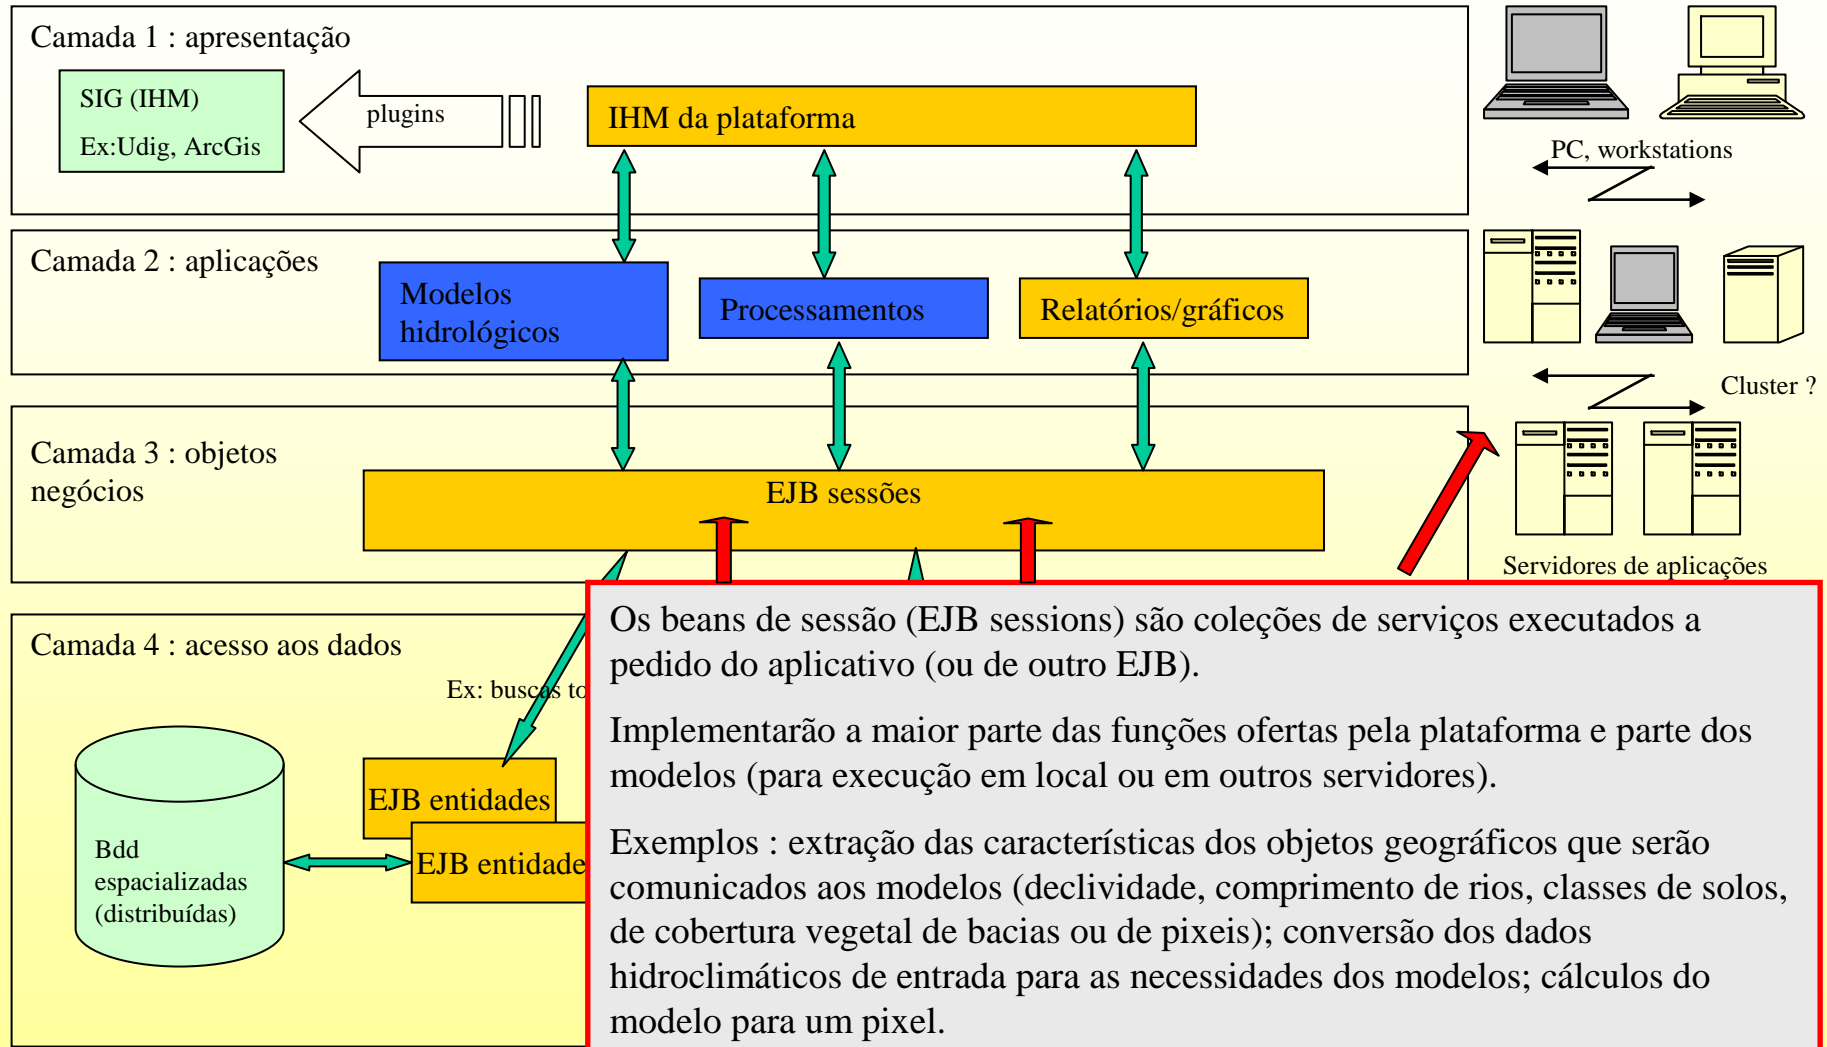

Plataforma de modelagem - Arquitetura

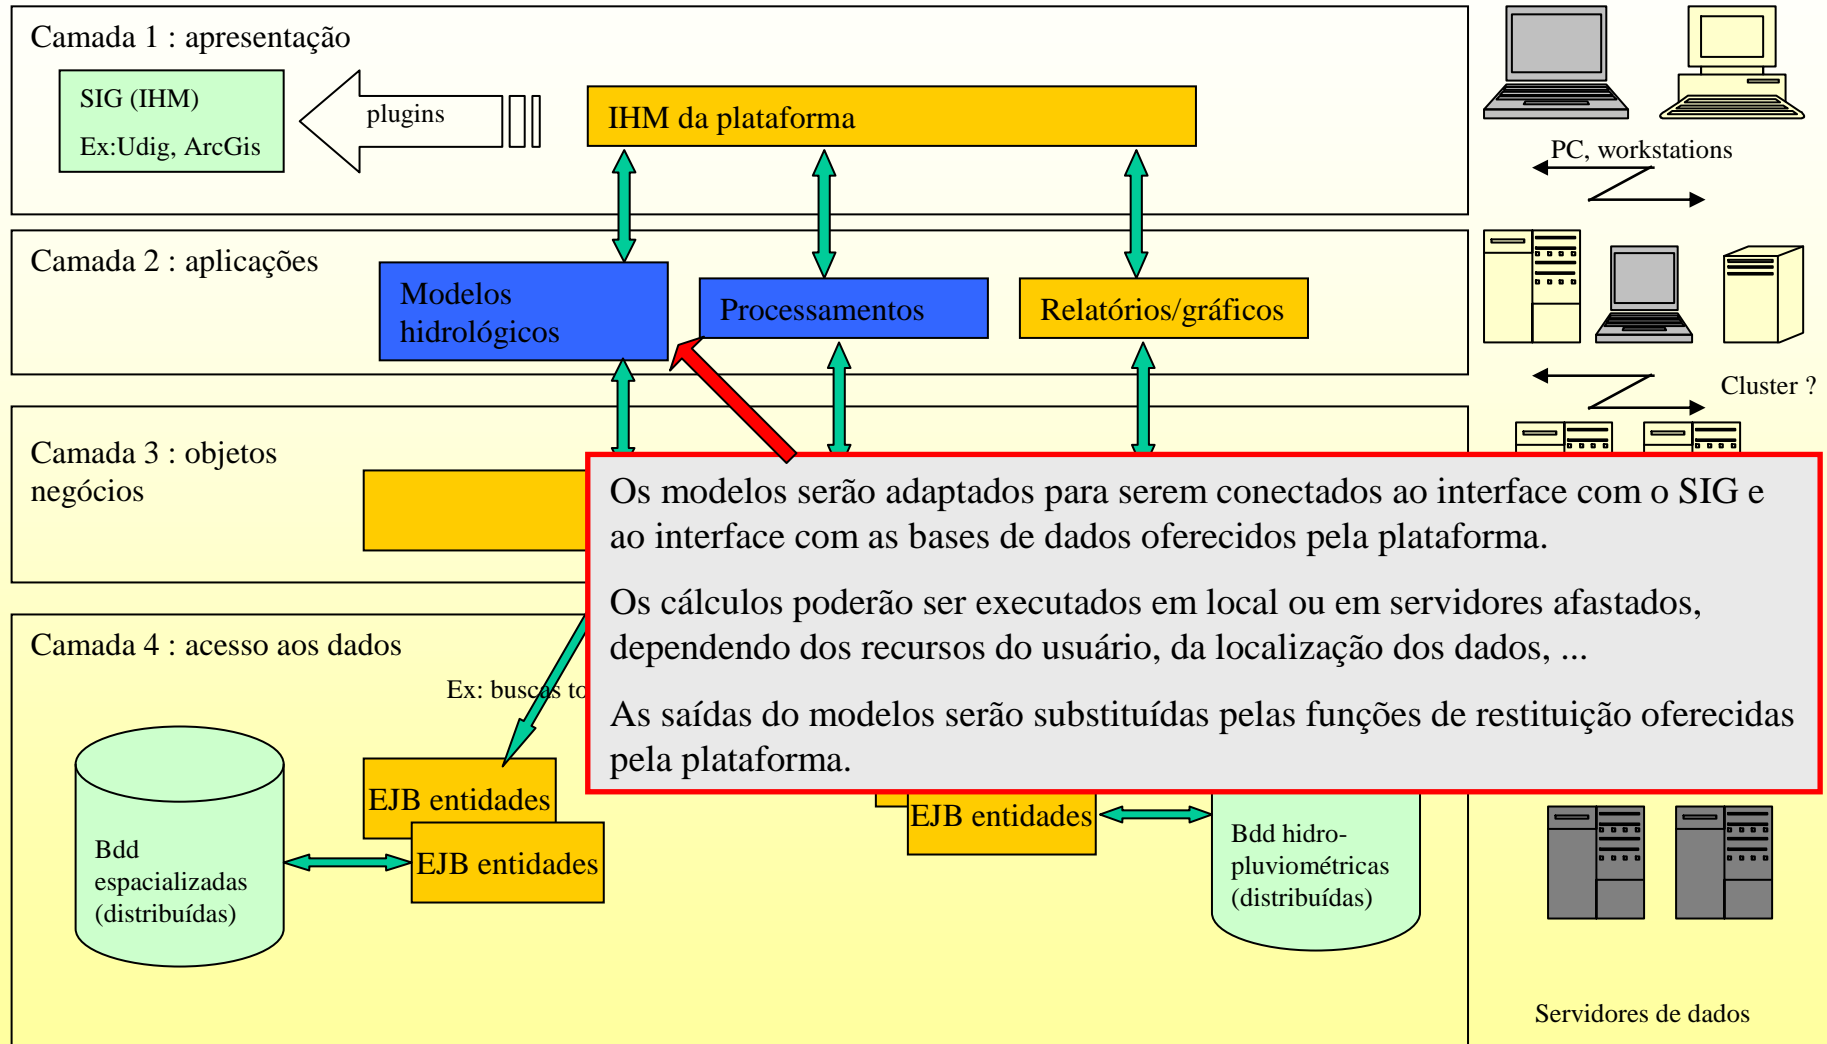

Os beans de entidades (EJB entities) são utilizados para comunicar com as bases de dados distribuídas, tornando a aplicação o máximo possível independente da base de dados. Existem ferramentas de geração automática de boa parte do código fonte dos mesmos, facilitando o desenvolvimento.

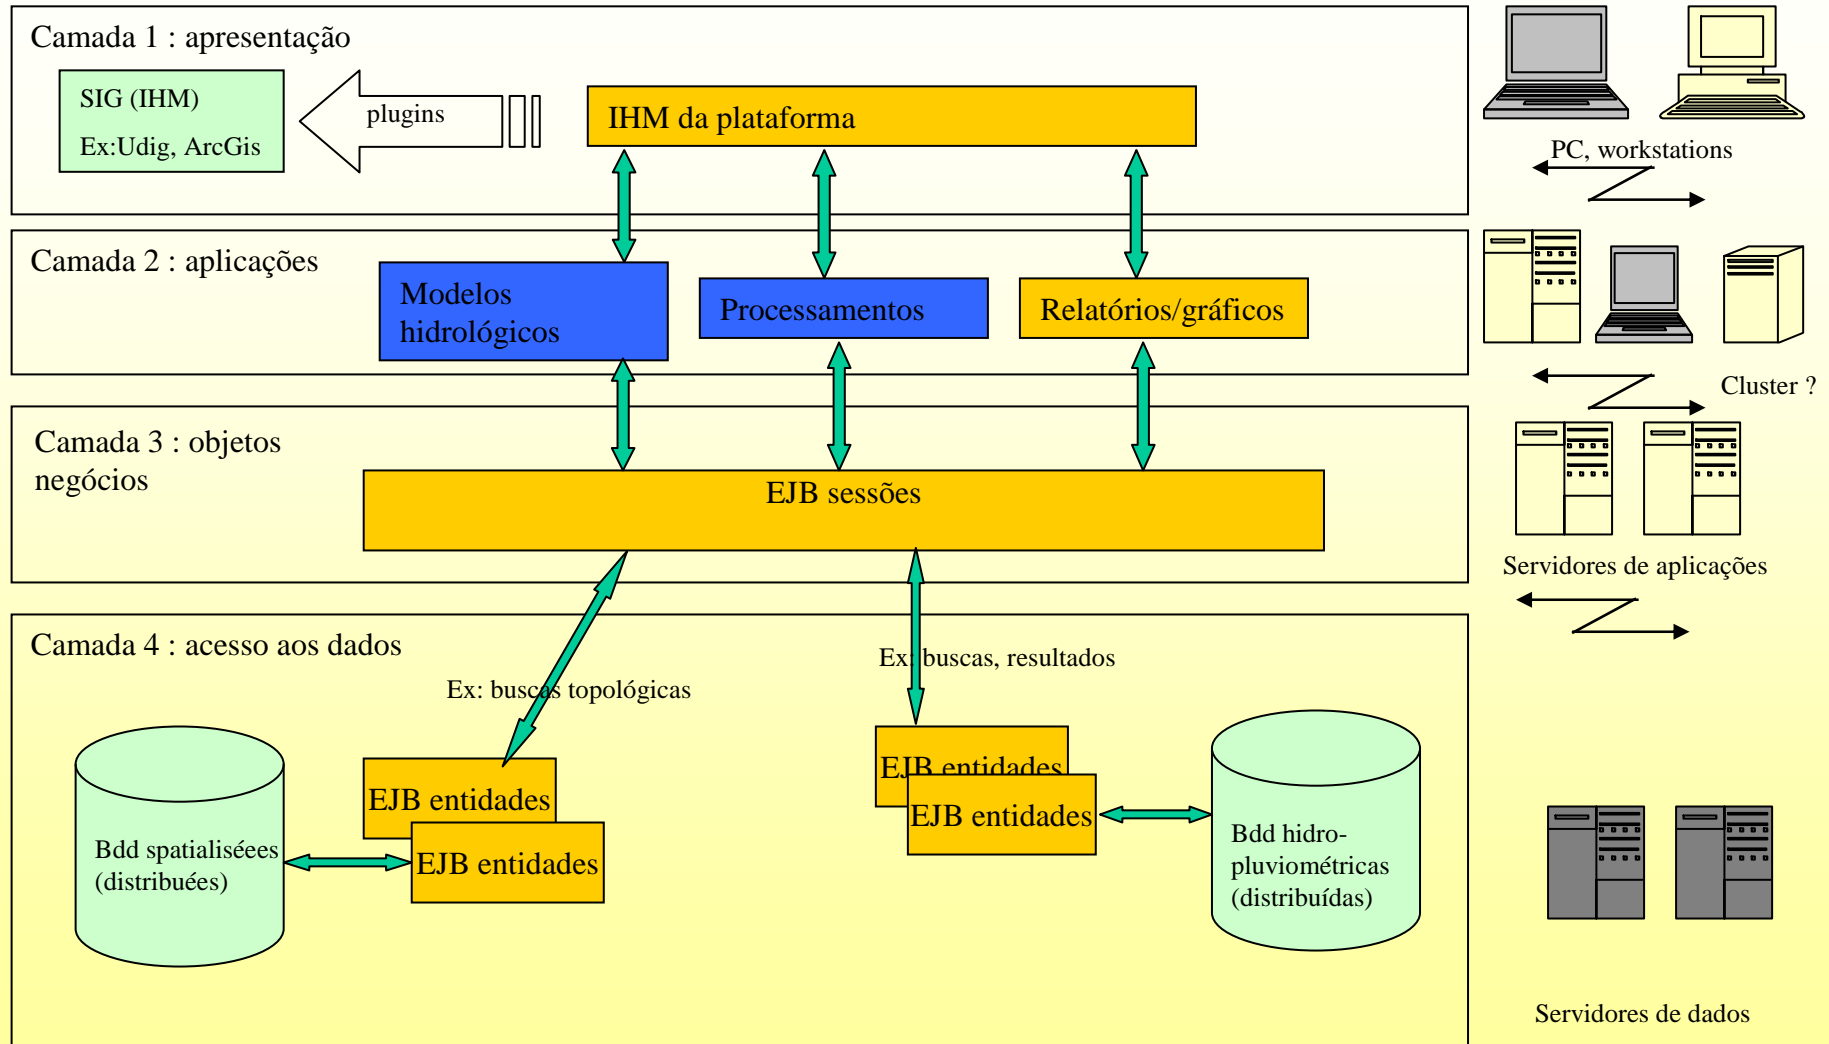

Plataforma de modelagem - Arquitetura

Plataforma de modelagem - Arquitetura

Plataforma de modelagem - Arquitetura

Plataforma de modelagem – Ambiente de desenvolvimento

- **Especificação J2EE (Java 2 Enterprise Edition) : bem adaptada ao caráter distribuído que se quer dar para a plataforma.**
- **Um processo de desenvolvimento (2TUP) : iterativo e incremental, focalizado na arquitetura, organizado em torno dos casos de utilização e monitorado pelos riscos.**
- **Netbeans para a modelagem UML : modelagem adaptada ao 2TUP.**
- **Plataforma de desenvolvimento Eclipse e suas extensões Visual Editor, Subclipse : facilidade para integração de Plugins.**
- **Netbeans para a geração de código para os beans de entidades : acesso aos dados independente da base de dados (MySql, Postgresql).**
- **Entre os componentes J2EE, uso de JNDI e EJB para produzir componentes distribuídos e independentes do gerenciador de base de dados, JNI para interface com código C e Fortran.**
- **Um servidor Subversion (gerenciador de fontes com controle de versão) : permitir o desenvolvimento colaborativo.**
- **Um gerenciador de base de dados PostgreSQL e a sua extensão Postgis : gerenciamento de objetos georeferenciados et geométricos, buscas especializadas.**
- **Um sistema de informações geográficas : Udig (open source), e ArcGis (?).**

Two Track Unified Process (2TUP)

An agile software development
process

Few reminders

since 70's

- Object-oriented programming (Smalltalk, Eiffel, C++, Java, Fortran 2003, ...)

⇒ software bricks assembly concept

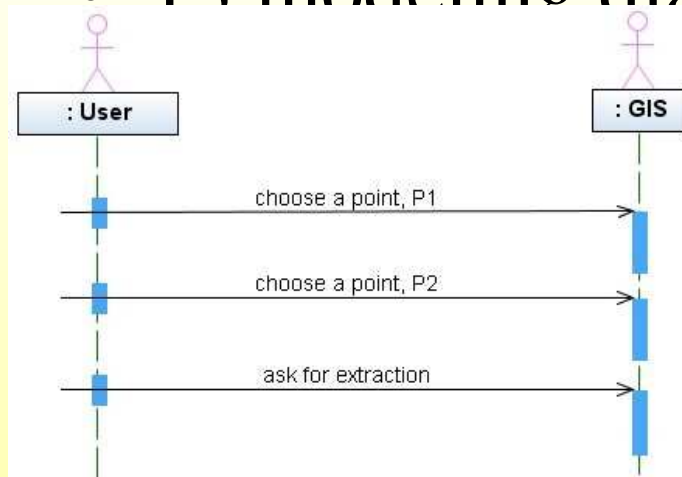

- Modeling languages : SADT, Merise but mostly UML

⇒ software modeling

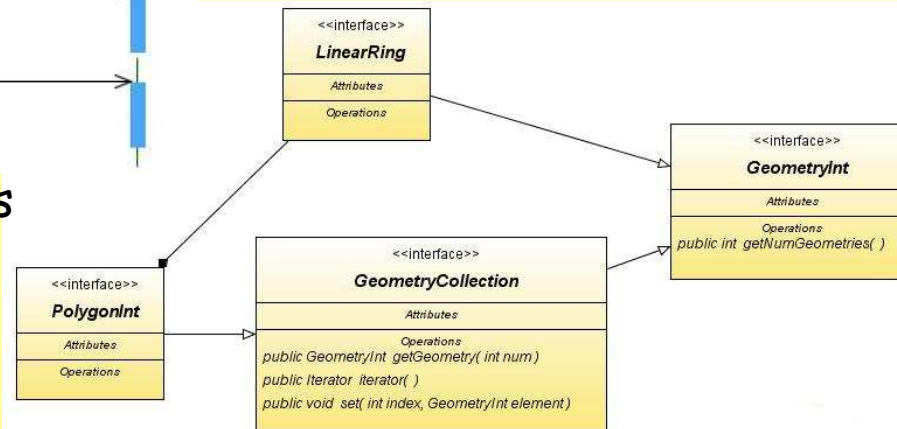

Unified Modeling Language

- 13 modeling diagrams

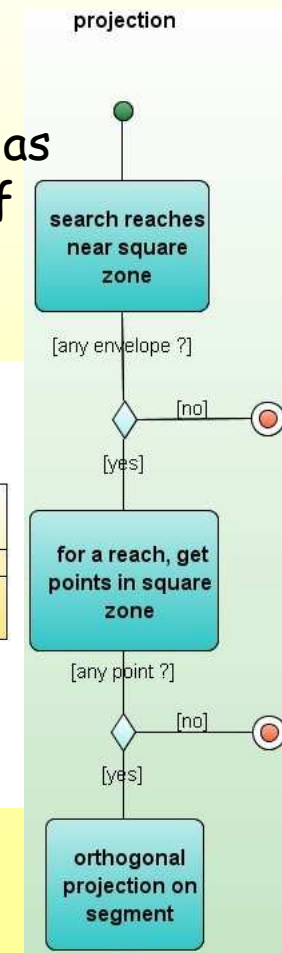

Sequence diagram as Representation of class's relationships

Class diagram as static Structure diagram

Activity diagram as representation of algorithm

Development process

So as to :

- Organize development
- Manage project
- Team work

Solutions

since 2000's

- Agile process :
the Unified Process family (2TUP, RUP, XP, ...)
- Intense use of UML

Two Track Unified Process (2TUP)

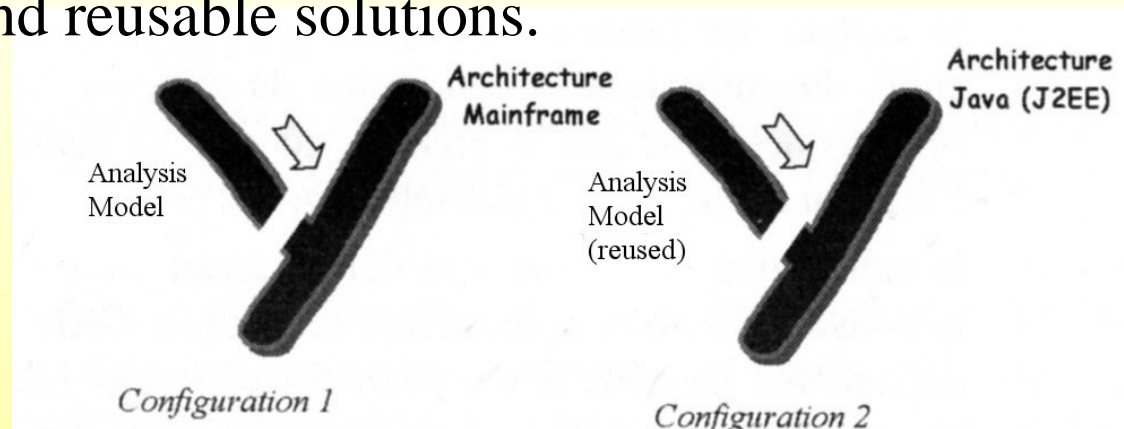

since 2002

2TUP

- Functional and technical solutions separated :

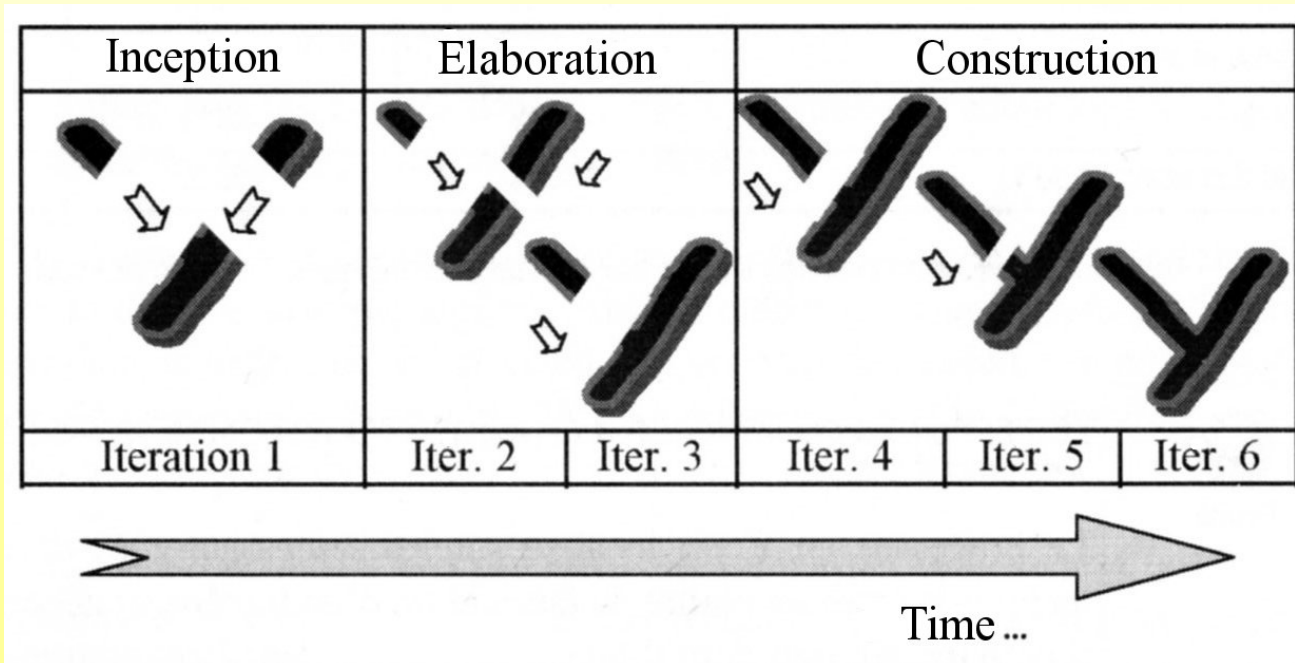

=> Independent and reusable solutions.

2TUP

- Incremental and iterative process

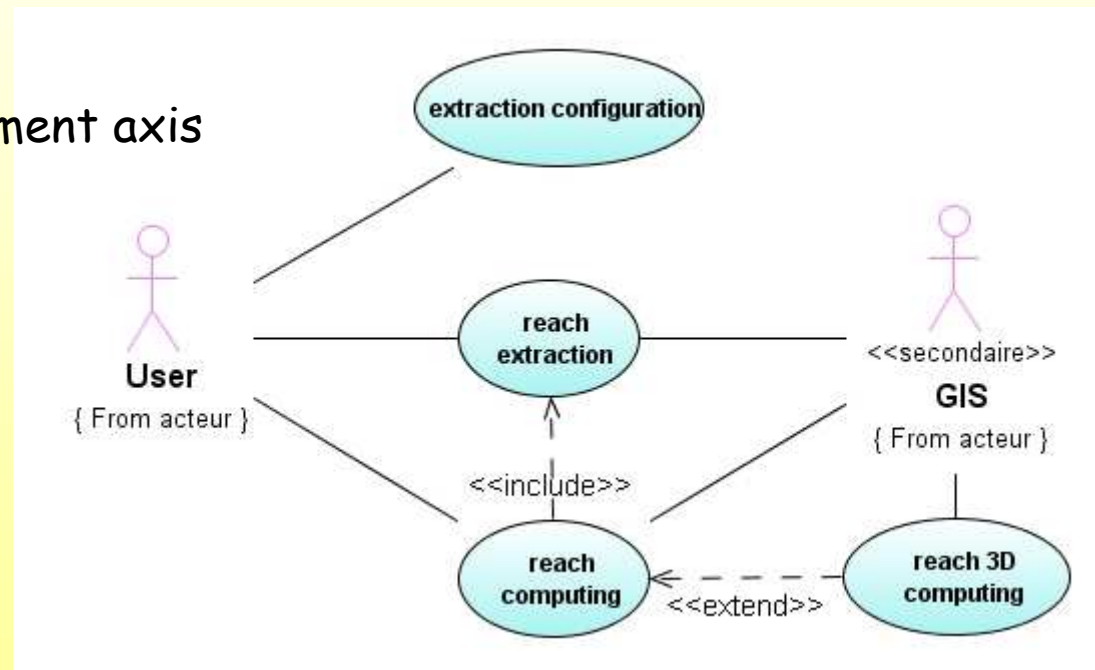

=> the software is, step by step, improved

2TUP

- Managed by user (use case)

User needs are development axis

The software do what the user want it to do (we hope so !)
